LETTER OF RECOMMENDATION

To Whom It May Concern

It gives me great pleasure to write this letter of recommendation for Mr. **Akshit Sahore** who successfully completed a six-month internship with **NV Global Tech** as a **Full Stack Developer Intern**.

During the internship period **[15-09-25 – 28-02-26]** Akshit Sahore worked on our live production job-seeking platform serving real users, where he demonstrated exceptional technical competence, ownership, and systems thinking ability.

One of his most significant contributions was designing and structuring our **production-grade payment gateway workflow**. He formally defined the complete order lifecycle including order creation, verification logic, backend validation, and failure handling mechanisms to ensure transactional integrity. His work emphasized idempotent operations, edge-case handling, and data consistency—critical requirements for production financial systems.

Additionally, he architected the **subscription lifecycle management system**, clearly defining subscription states and controlled state transitions. This ensured accurate synchronization between payment confirmations and user access control. He also implemented backend safeguards to prevent duplicate processing, maintaining reliable coordination between external payment callbacks and internal subscription activation.

Beyond payments, he contributed to the implementation of our **OTP-based authentication system** and independently optimized it by carefully evaluating security-performance trade-offs. His enhancements included improved validation logic, structured expiry handling, and abuse prevention strategies to enhance system reliability.

What sets Akshit Sahore apart is his architectural mindset. He consistently approached feature development from a long-term reliability, scalability, and maintainability perspective rather than focusing solely on implementation. He actively participated in architectural discussions and proposed thoughtful improvements to payment validation flows and authentication reliability mechanisms.

In addition to his technical contributions, he demonstrated leadership qualities by mentoring and onboarding new developers, guiding them through backend architecture, workflow structuring, and development standards. He operated with a high degree of ownership and independence, often handling responsibilities typically assigned to experienced engineers.

Throughout his internship, he aligned business requirements—particularly subscription monetization—with scalable backend design principles, showcasing strong systems-level thinking and professional maturity.

I strongly recommend Akshit Sahore for any advanced academic pursuit or professional opportunity in software engineering, backend architecture, or systems development. I am confident that he will be a valuable asset to any organization or institution.

Please feel free to contact us for any further information.

Sincerely,
Vishwam Solanki
